Spreading of correlations: Why bother?

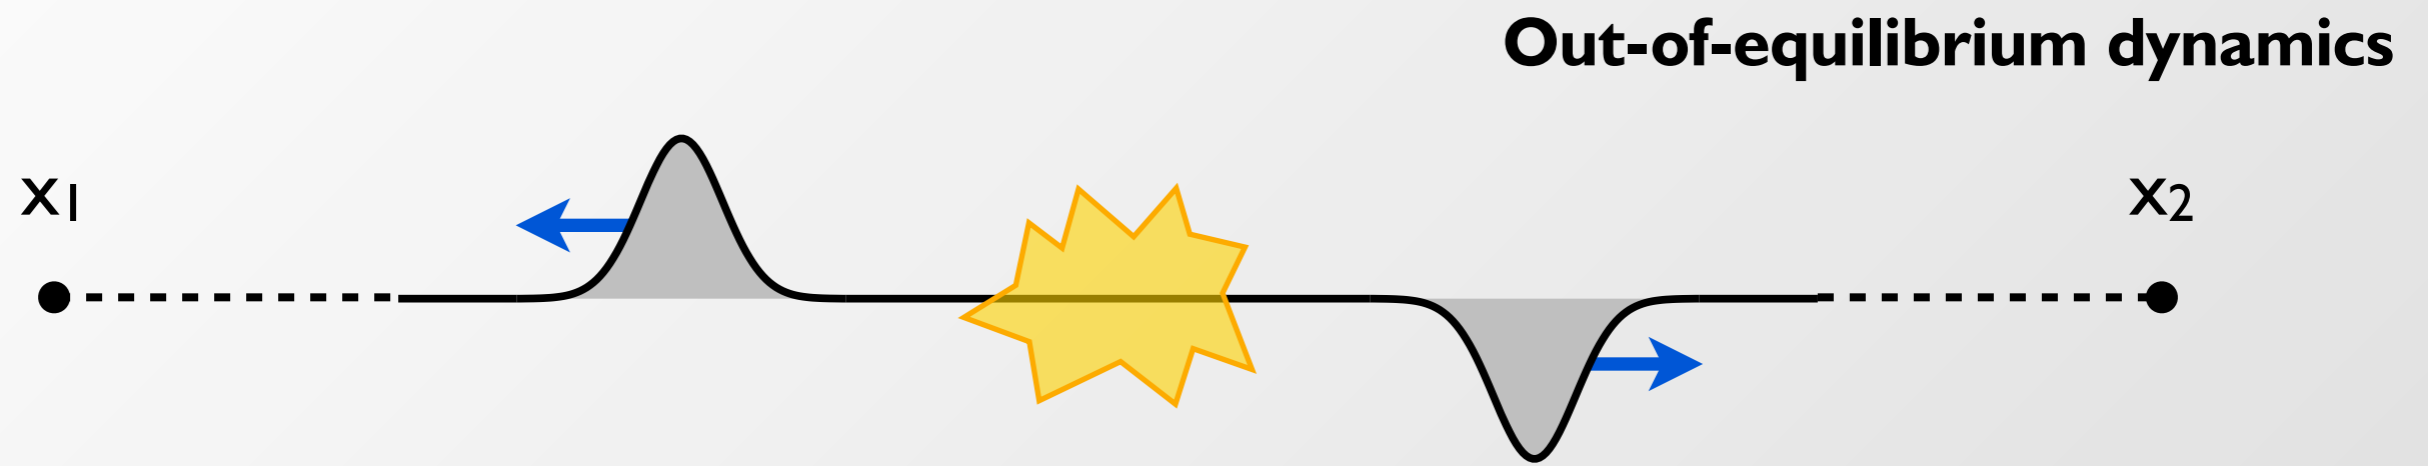

- **Relaxation dynamics** of a quantum many-body system:

$$\langle O(x_1) O(x_2) \rangle_{\text{initial}} \qquad \langle O(x_1) O(x_2) \rangle_{\text{final}}$$

redistribution of correlations

Spreading of correlations: Why bother?

- **Relaxation dynamics** of a quantum many-body system:

$$\langle O(x_1) O(x_2) \rangle_{\text{initial}} \quad \langle O(x_1) O(x_2) \rangle_{\text{final}}$$

redistribution of correlations

- **Transport of information** in quantum channels

How fast can correlations propagate?

Equation of motion for the many-body field operator:

$$i\hbar\partial_t\hat{\psi}(x) = \frac{-\hbar^2}{2m}\partial_x^2\hat{\psi}(x) + \int dx' V(x' - x)\hat{\psi}^\dagger(x')\hat{\psi}(x')\hat{\psi}(x)$$

How fast can correlations propagate?

Equation of motion for the many-body field operator:

$$i\hbar\partial_t\hat{\psi}(x) = \frac{-\hbar^2}{2m}\partial_x^2\hat{\psi}(x) + \int dx' V(x' - x)\hat{\psi}^\dagger(x')\hat{\psi}(x')\hat{\psi}(x)$$

In some cases

Lorentz invariant effective Lagrangian

$$L \propto \int dx \left(|\partial_t \theta|^2 - c^2 |\partial_x \theta|^2 \right)$$

$$L \propto \int dx \left(|\partial_t \psi|^2 - c^2 |\partial_x \psi|^2 + r|\psi|^2 - u|\psi|^4 \right)$$

c = sound velocity

Beyond quantum spins

- The proof for the existence of a Lieb–Robinson bound usually relies on 3 conditions:
finite-range interactions, lattice and finite local Hilbert space

Beyond quantum spins

- The proof for the existence of a Lieb–Robinson bound usually relies on 3 conditions: **finite-range interactions, lattice** and **finite local Hilbert space**
- In the **Bose–Hubbard model**, the number of particles per site is **not bounded**

$$\hat{H} = -J \sum_i (\hat{a}_i^\dagger \hat{a}_{i+1} + \text{h.c.}) + \frac{U}{2} \sum_i \hat{n}_i (\hat{n}_i - 1)$$

Group velocity

Due to the band structure, there exists a **maximum group velocity**

Group velocity

Due to the band structure, there exists a **maximum group velocity**

Notes:

- We artificially limit the local Hilbert space to 2 states
- The maximum group velocity increases with the lattice filling (Bose enhancement of the tunnel coupling)

Beyond the quasiparticle model

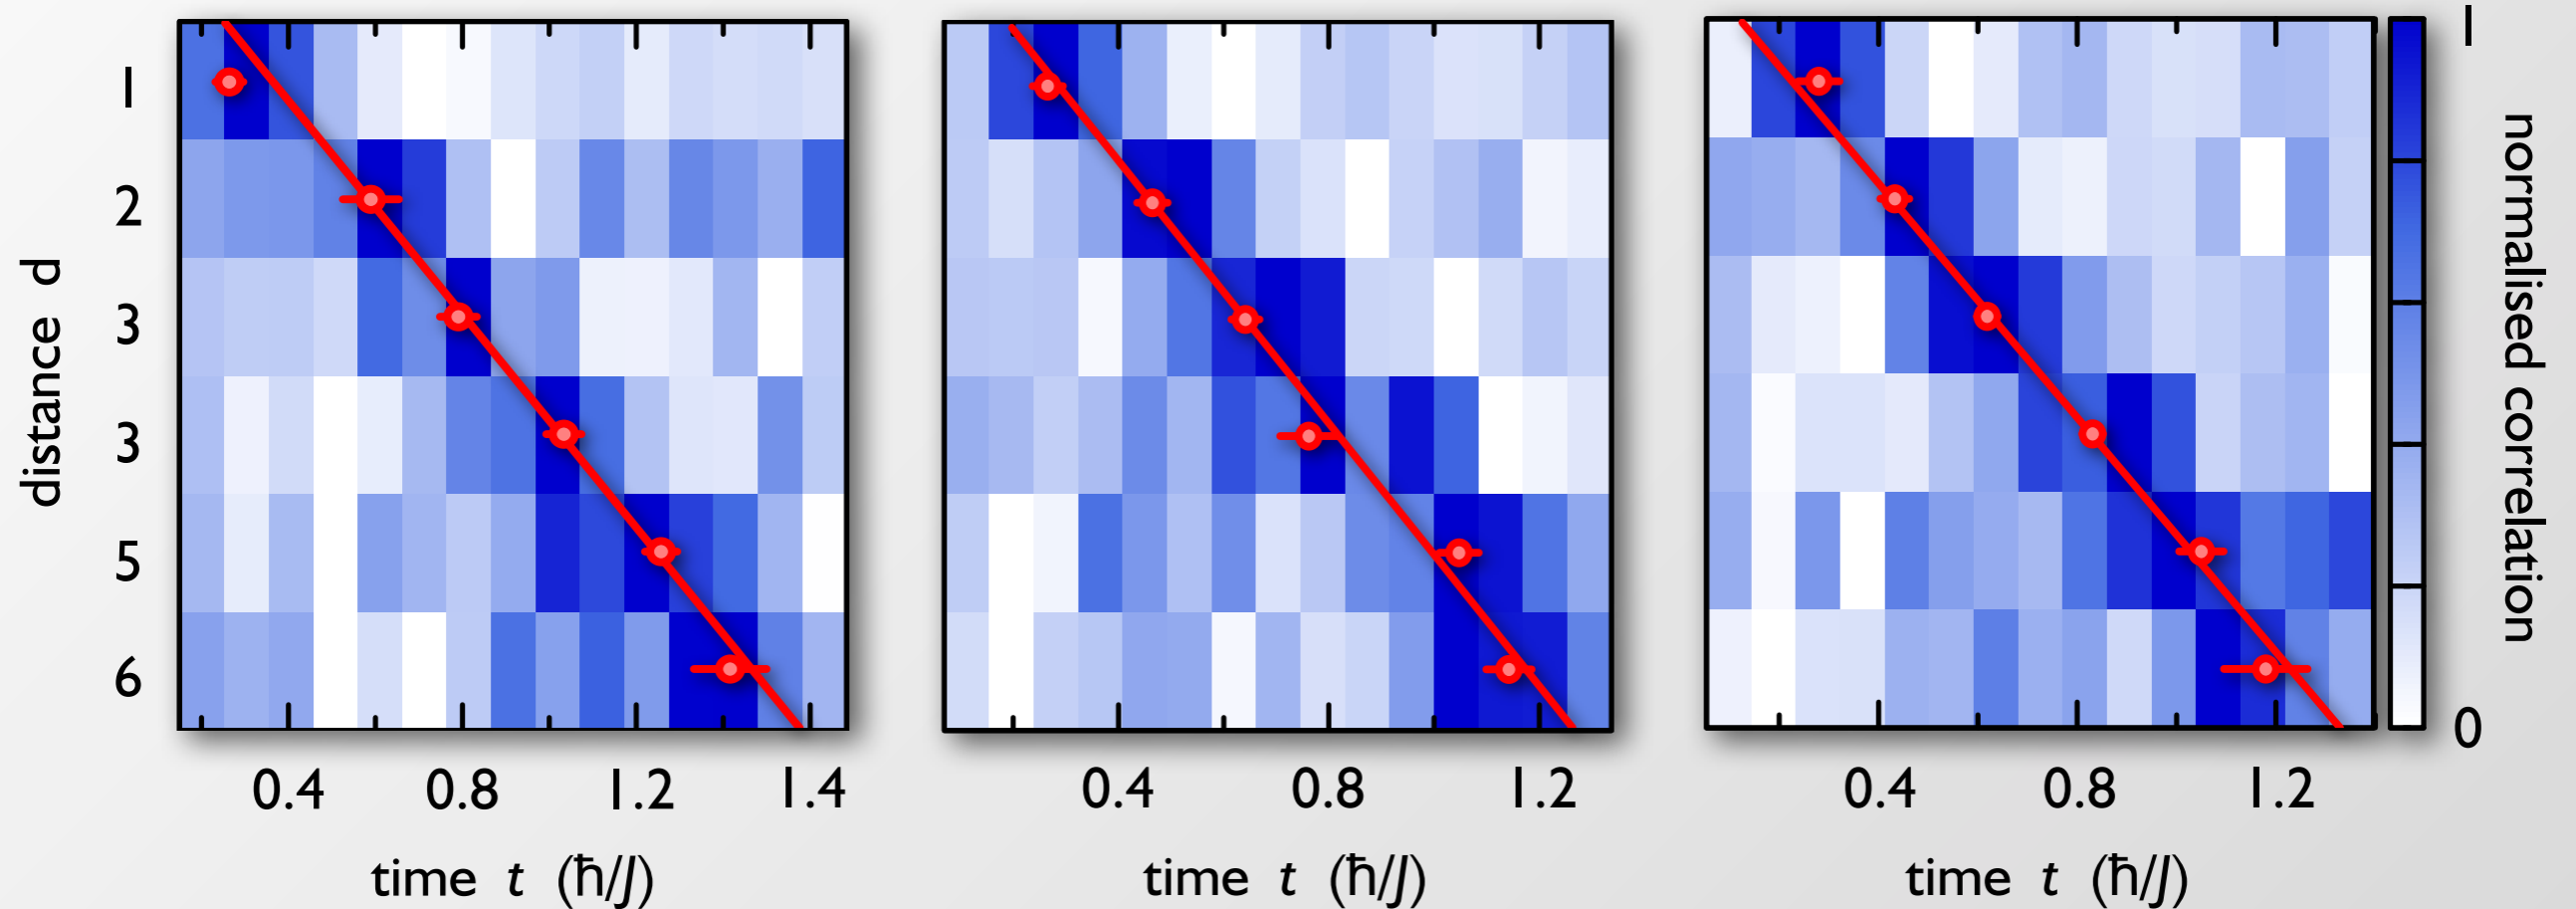

Quasiparticle picture breaks down

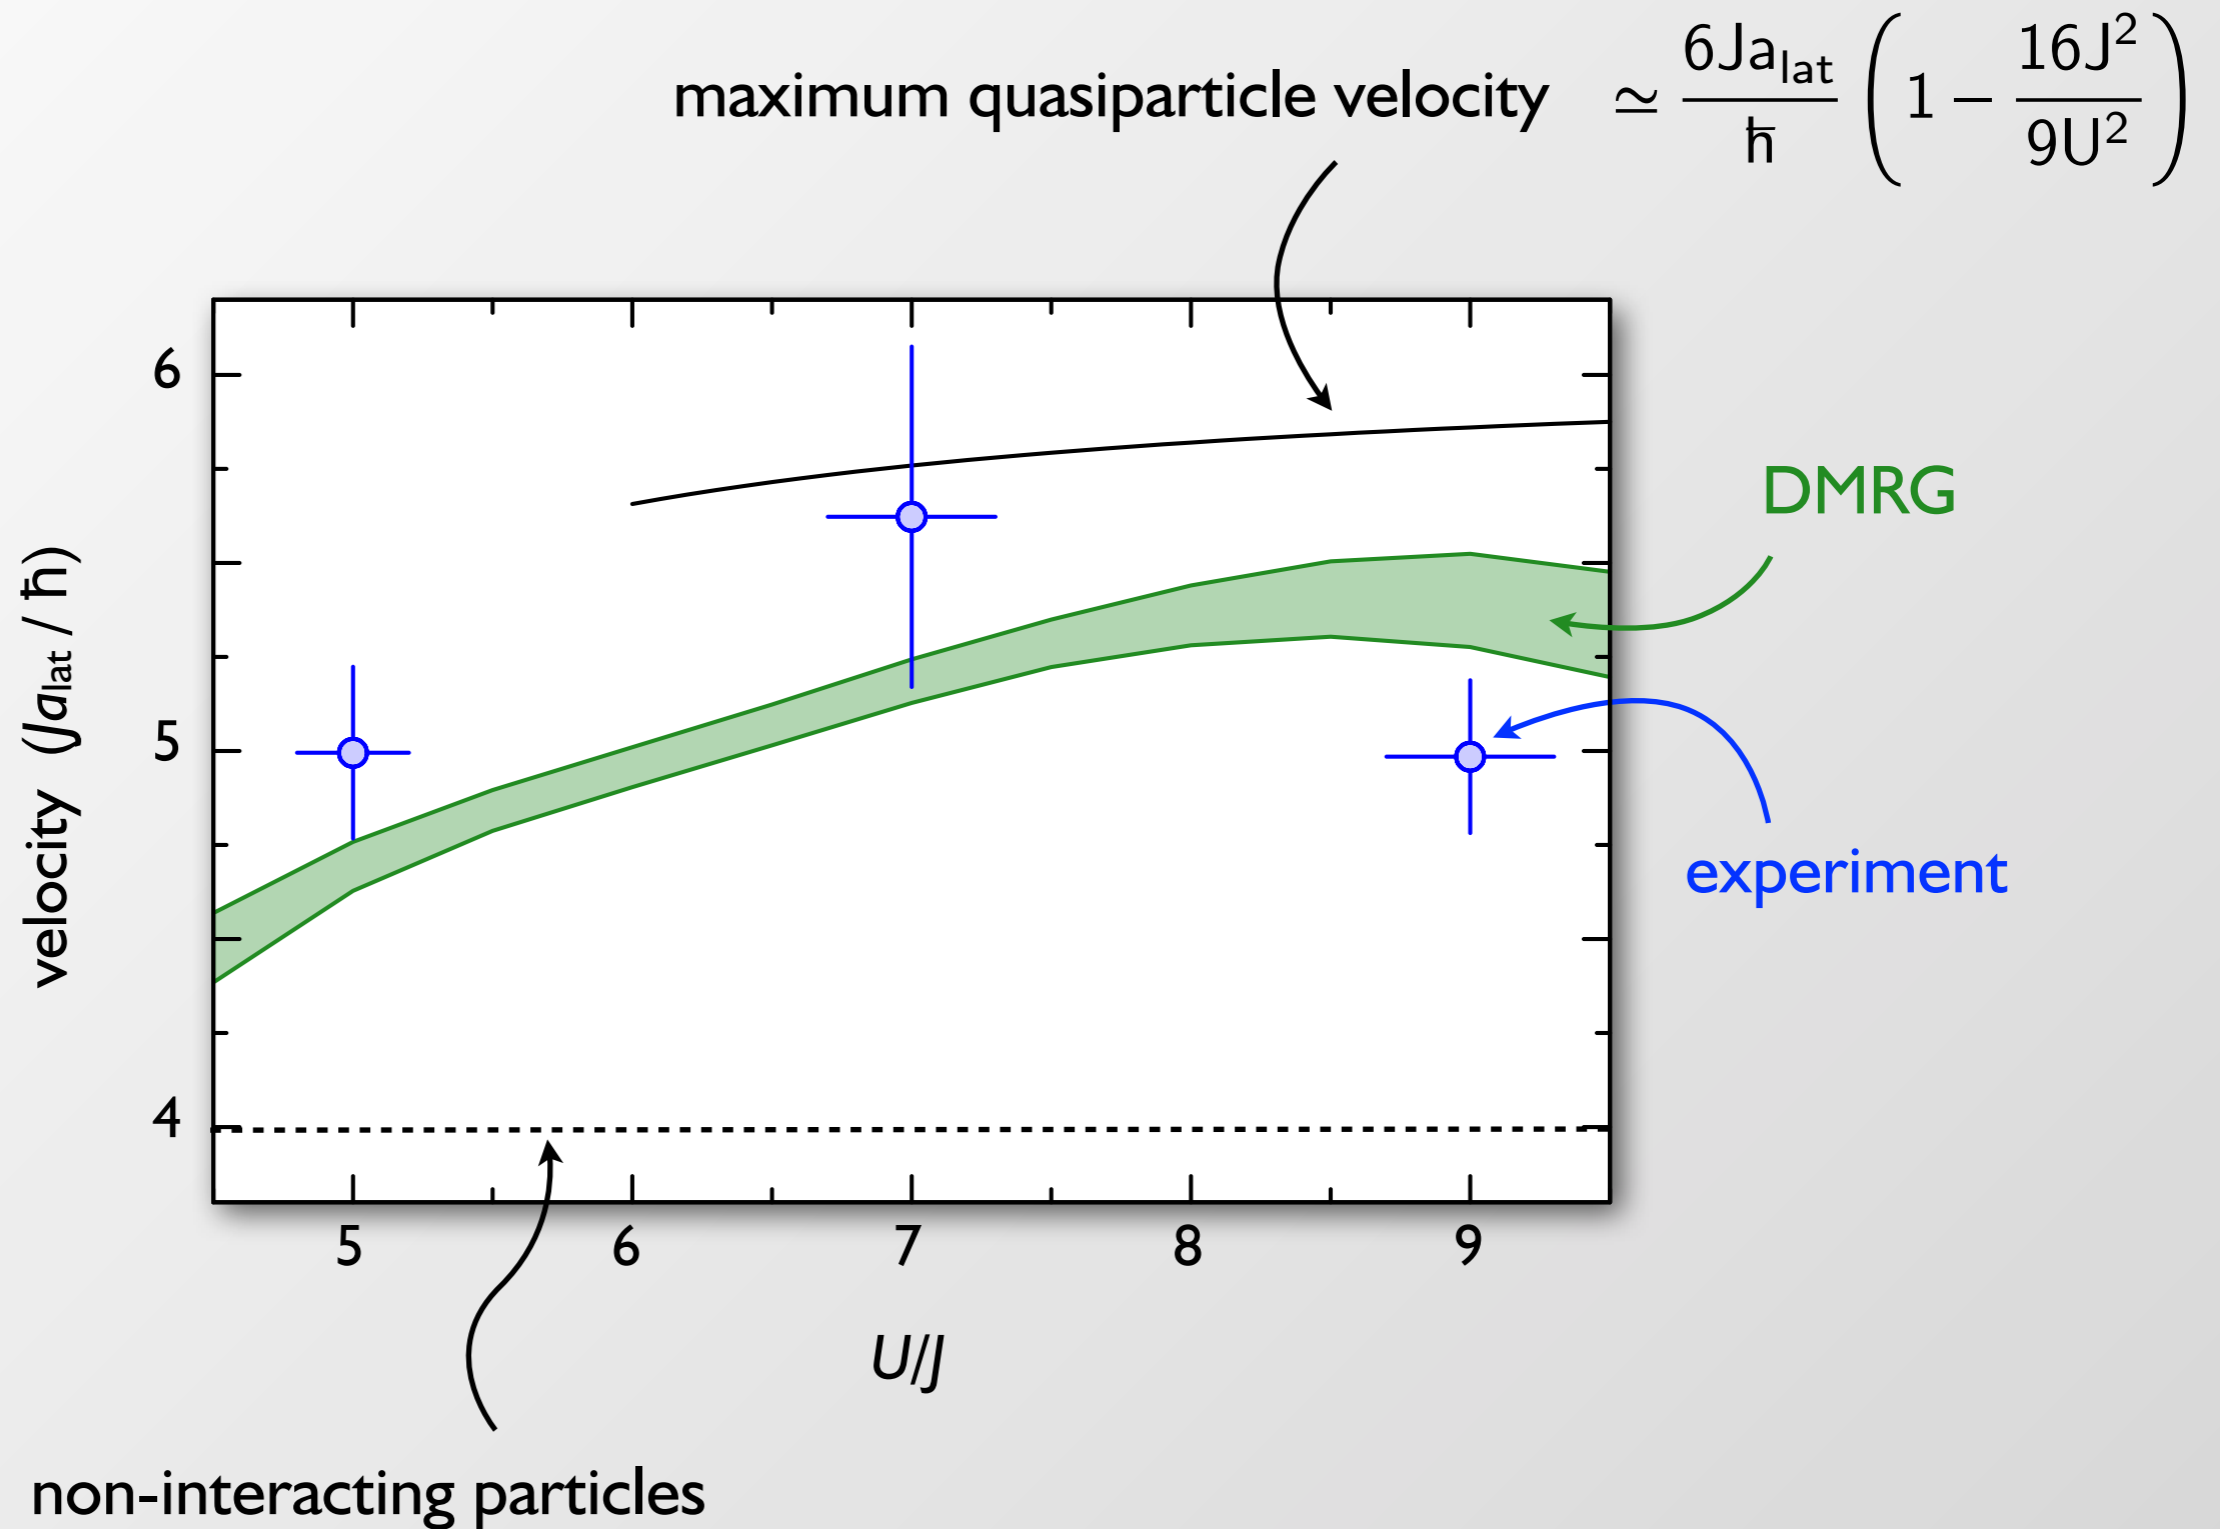

final $U/J = 5$

final $U/J = 7$

final $U/J = 9$

Spreading velocity

- Relaxation dynamics in the Mott regime driven by the propagation of entangled particle-hole pairs
We can see them!!
- At finite energy and particle number, there exists a maximum group velocity for the propagation of the quasiparticles
- Can we speak of a Lieb–Robinson bound?
- The light-cone dynamics is related to the linear increase in time of the entanglement entropy
- What happens in 2D? (*Talk by Ludwig Mathey*)
- Is this a generic feature of quantum systems with finite-range interactions???
